

BRUNO COLIN

2022

VERY BEAUTIFUL AND PROMISING

A mild, dry winter followed by a shivering cold current:

After a milder and drier than average winter, the very first green spikes in early areas appear at the beginning of April.

A mass of cold air coming from the north then caused temperatures to drop throughout Burgundy, which once again had to fight against 4 nights of frost between April 3 and 11. We fear the worst. Fortunately, at this time, a large part of the vines are still protected, because they are at the "bud in cotton" stage.

A rapid start to growth

In mid-April, spring-like conditions set in for the long term and the vines developed rapidly...A month later, the first flowers were observed in the most advanced sectors!

Two weeks ahead of average and under dry and hot conditions, flowering occurs. The release of the bunches portends a good harvest.

Hope with the rain

Fruit setting begins around two weeks earlier than average. The development of the berries takes place under the sun with high temperatures. The arrival of storms from June 21 to 25 brings precious water at a crucial stage for the plant. They are nevertheless locally violent.

A hot or even scorching summer at certain times

Summer is marked by a succession of heat waves. Happy consequence for winegrowers: the absence of disease. The consequences of drought are limited, because the vine is a plant that tolerates water stress quite well.

Harvest under the sun

The early harvest took place from August 29 to September 10 under optimal conditions with very good health, suggesting a great vintage.

White wines :

The white wines are rich, elegant with great purity, mixed with beautiful aromas of fresh fruit, they are distinguished by a lovely concentration and perfect balance on the palate.

Red wines :

The red wines are distinguished by a dense color with a beautiful freshness, the phenolic compounds being at their optimum, and can age admirably for a few years to reveal all their potential.
